List of Tables

3.1	Short table caption appears only in List of Tables.	19
3.2	The same silly table again, but with a really long caption.	21

List of Figures

3.1	Short caption for table of figures.	17
3.2	The Duke logo again, but now with a really long rambling caption. This caption should be set single-spaced in the LoF and in the body text. What do you think about having graphics in the main di- rectory of a project? I'd prefer them in a folder, then put 'folder- name/picturename' as the argument to includegraphics.	21

List of Abbreviations and Symbols

Symbols

Put general notes about symbol usage in text here. Notice this text is double-spaced, as required.

\mathbb{X}	A blackboard bold X . Neat.
\mathcal{X}	A caligraphic X . Neat.
\mathfrak{X}	A fraktur X . Neat.
X	A boldface X .
X	A sans-serif X . Bad notation.
X	A roman X .

Abbreviations

Long lines in the `sympollist` environment are single spaced, like in the other front matter tables.

AR	Aqua Regia, also known as hydrochloric acid plus a splash of nitric acid.
SHORT	Notice the change in alignment caused by the label width between this list and the one above. Also notice that this multiline description is properly spaced.
OMFGTXTMSG4ME	Abbreviations/Symbols in the item are limited to about a quarter of the textwidth, so don't pack too much in there. You'll bust the margins and it looks really bad.

Acknowledgements

Thank anyone you like here. It's good practice to thank every granting agency that's given you money since you've been ABD, any other school you visited during your research, and any professional society that's funded your travel.

1

Introduction

Much of our economic and political life is governed by a two-sided matching process, in which two sets of actors evaluate each other's characteristics and voluntarily form a match if deemed satisfactory. Marriage is a prominent example of such process. Others include the matching of firms and workers, federal judges and law clerks, countries and multinational firms who want to make an investment, or the *formateur* of a government and other minority parties.

Two sided matching market is substantively consequential because it involves scarce, one-of-a-kind “good”, such as a life commitment to a marital partner, or a political allegiance in a government formation—certainly not the commodity like loaves of bread. It is also intellectually interesting because its different structure means that our understanding of the normal, one-sided market is inadequate to explain and analyze.

A two-sided market means that the market involves two disjoint set of actors, and one side decision affect the other side (Rysman, 2009) who evaluate each other's characteristics. For example, in a marriage market, both men and women evaluate one another's income, appearance, background, to consider a match. This stands in

contrast with one-sided market in which only one side makes the judgment whether a transaction exist, e.g. a grocery shopper evaluates the plumpness of the grocer's tomato, while the grocer does not evaluate the shopper. This means that whether a transaction occurs depend not only on an individual's demand, but also on the individual's opportunity. Indeed, while we typically assume that in a grocery market, all the milk and tomato are always available to buy, and the sole decision is to buy how much, in a marriage market, the no less important question is what is available to the individual.

A matching market means that once a match is being made, the transaction is exclusive between the two individuals being matched. Once a match has been made, both sides are no longer available on the market. This results in strategic behaviors, i.e. delaying accepting an offer, falsifying preference, that causes market failures. For example, in many matching markets, such as the American physician market 1945-51, the American law graduate market, the elite Japanese university graduate markets, all suffer from the problem of offers being made aggressively earlier in order to scoop the best candidates from the market.

The study of two sided matching markets start within the market design subfield of economics, where scholars are chiefly concerned with explaining the market failures in the market, and how to design a mechanism to resolve such failure. In such studies, the preferences of the actors are given, and the goal is to find a "stable" matching.

The first work in this tradition is Gale and Shapely (1962) and Shapely and Shubik (1972). Some key proofs: - From any set of preference, a stable matching always exist - From a random matching, we will converge to a stable matching with probability one.

1.0.1 History of the game theory

(Gale and Shapley, 1962) was the first to study the one-to-one matching market,

named the marriage market. In such a market, there are two finite and disjoint set of actors, men and women. Each man has preference over each woman, and vice versa. To each man and woman the option of remaining single is always available.

A matching μ is a function that matches a man with a woman. For convenience, we can say that if a man or woman decides to remain single, they are matched with themselves. We refer to $\mu(x)$ as the *mate* of x .

A matching can be improved upon in two ways. First, an individual can prefer to remain single than to be matched with his or her mate $\mu(x)$ under the current matching μ . Second, a man and a woman can improve a matching if they prefer to be with one another rather than whom they are currently matched with. Therefore, we define that a matching μ is stable if it cannot be improved upon by any individual or any pair of agent.

The first result from (Gale and Shapley, 1962) that is relevant to our purpose is that for any set of preference, there will always be a stable matching. This means that it is reasonable for us to assume that the process that generates the final match we observe in the data is one of agents maximizing their utilities. Crucially, this provides the justification for us modeling their choice using the familiar tools in the discrete choice literature.¹

(Gale and Shapley, 1962) treats the case of many-to-one matching (which they call the “college admission” game) essentially the same. However, Roth and Sotomayor

¹ (Gale and Shapley, 1962) provides a constructive proof of stable matching. They describe the process, called *deferred acceptance*, that produces the stable matching. The process works as follows. In the first stage, every man proposes to his preferred mate. Every woman rejects all of her suitors except the one that she most prefers. However, she does not yet accept her favorite suitor (so far), but keep him along. In the second stage, every man that was rejected proposes to his second choice. Every woman then picks her favorite from the set of new proposers and the man she keeps along from the last round. The procedure continues until there is no longer any woman that is unmatched. The resulting match is stable because, throughout the process, every woman has received all the offers that would have been made to her, and she has chosen her favorite among all of those offers. If there is any other man that she would prefer to her current match, that man would not be available to her. Therefore, the final match cannot be further improved by any man or woman.

(1992) shows that a well defined many-to-one matching game is slightly different. However, when generalize this model to many-to-one matching setting of firm and workers, all the striking results remain, but we do have to make the assumption of substitutability, meaning that firms treat workers as substitute, not complements. Formally, this means that firm never regret hiring a worker if another worker does not accept the offer. This is certainly not universally true: a football team strategizing for passing play may want to hire both a good passer and a good running back, and in the case one does not accept, will go to another strategy altogether.

So we know that a stable match always exist, meaning it is possible for agents to reach a final match that maximize their utilities. A central coordinator employing the *deferred acceptance* algorithm is guaranteed to reach this stable match. However, in a decentralized market without a central coordinator, would agents be able to reach this outcome by themselves? How likely is that this will happen. This matters for our empirical approach because we need to know whether the final outcome we observe is indeed a stable match, i.e. which would inform our estimation strategy. (Roth and Vate, 1990) shows that, starting from an arbitrary matching, the matching can converge to a stable matching with probability 1 if we allow random blocking pairs, i.e. a woman and a man that are not matched to one another but prefer each other to their current match, to match. In addition, (Adachi, 2003) shows that a random search process, in which man and woman randomly meet, evaluate, and decide to pair or not, will converge towards a stable match assuming that the search cost is negligible (specified as having a time discount $= 1$). This gives us confidence that the data we observed is close to a stable match, a fact that will guide us in our modeling strategy.

1.0.2 Empirical studies of two-sided matching market

Given the importance of many two sided matching markets, there have been many empirical studies that try to estimate the preference of participants in these markets. Below I discuss several examples, starting with the marriage and the labor market, where the two-sided matching literature started. Then I discuss the law graduate market and the FDI market, two markets that are relevant to politics, whose two-sided nature has not been fully appreciated and modeled accordingly.

Estimating preference is a difficult task, and throughout the discussion it will become apparent that most empirical approaches either 1) use survey to get the stated preference, not revealed preference, or 2) failing to consider the two-sided nature of the market in their estimation method, thus unable to distinguish between preference and opportunity. Our two-sided matching model aims to address both these shortcomings: it will estimate preference based on observed match, i.e. revealed preference, and will be able to distinguish between the effect of opportunity and choice.

Labor market

(Abowd et al., 1999) is also estimating preference, disentangling the two-sided effect, but require salary data.

Law graduate market

In the United States, graduates at top law schools vie for the best federal clerkships as they are often the launching pad for Supreme Court clerkship, prestigious teaching jobs or positions at top law firms. On the other hand, federal judges also compete for the best law graduates, who help reduce the judges' workload, from copy-editing, to research, and even drafting the opinions (Posner, 2001; Gulati and Posner, 2016, 795)

(Rozema and Peng, 2016) is the first quantitative model of the law clerk market. It's the first to model the process as a discrete choice problem, in which clerks are differentiated products that the Supreme Court justices pick in order to maximize their utilities. However, it doesn't consider the other side of the market, i.e. the decision of the clerks. This article gets away with this assumption because a Supreme Court clerkship is the most prestigious legal position for law graduates, so the authors argue that no graduates will turn down an offered clerkship. However, if we want to extend the model to the broader market for law clerks, it is imperative to consider the utility of the law clerks as well.

Indeed, as (Posner, 2001; Posner et al., 2007) surveyed, the competition among federal judges for top law graduates is fierce, causing the starting date for making offer to law graduates to be continually pushed up. Law graduates not only care about the prestige of the job, but also other factors of a job like quality of life. A judge confessed that, living in a country town, he feels pressured to start making offer earlier to have any chance of recruiting a good law graduates (Posner, 2001). The competition is so fierce that, despite a moratorium on making offer earlier than the 3rd year of the law graduates, most judges say that their peers mostly don't adhere to the moratorium (Posner et al., 2007).

(Bonica et al., 2017) is another example of how empirical study that doesn't take into the two sided nature of the market will produce curious empirical study. For example, they argues that Judges hire clerks with consistent ideology (p 21), and that they tend to hire clerks with the same ideology as theirs. However, they also note that conservative tend to hire more liberal clerks, more so than liberal clerks hiring conservative clerk. This potentially is because most top school clerks are liberal. Without taking the pool of applicant into account, we can wrongly mistake this as conservative judges having a preference for liberal clerks. Indeed, they calculate clerk-based ideology for judge by simply taking the average (p 35). This will be

wrong because what a true clerk-based measure of ideology would be the judge's preference for the clerk's ideology, which I can measure here.

The machine learning approach

Duke Dissertation Class Documentation

Haario et al. (2001)

`dukediSSERTation.cls` — a document class for dissertations and theses conforming to the 2011 Duke University guidelines. This class is by Michael Gratton and modified by Hugh Crumley. It is based on the 2004 L^AT_EX2 ϵ version of `report.cls` and code in the older `dukethesis.cls` dating back to 1987.

The `report.cls` is Copyright 1993 1994 1995 1996 1997 1998 1999 2000 2001 2002 2003 2004 The L^AT_EX3 Project.

The original `dukethesis.cls` contained work by Mark Holliday, Charlie Martin, Russ Tuck, Sean O’Connell, Michael Todd, Syam Gadde, and Rajiv Wickremesinghe. Some of this work has been folded into the new document class.

This file may be distributed and/or modified under the conditions of the L^AT_EX Project Public License, either version 1.3 of this license or (at your option) any later version. The latest version of this license is in <http://www.latex-project.org/lppl.txt> and version 1.3 or later is part of all distributions of L^AT_EX version 2003/12/01 or later.

This is the June 13,2011 version, 0.5,(updated by Hugh Crumley) by Michael

Gratton.¹

2.1 Features

This class conforms to the 2011 style guidelines for dissertations, including:

1. Page numbers centered in the footer of each page
2. Margins: 1in top, 1in right, 1.5in left, 1in below footer
3. Title signature page, UMI abstract title signature page, and copyright page automatically generated at `\maketitle`
4. 'Double' spacing throughout body text (really about 10pt extra instead of 12pt extra.)
5. Double spacing between and single spacing within the Table of Contents, List of Tables, List of Figures, Bibliography, and in chapter, section titles, and figure/table captions.
6. Footnotes are numbered consecutively within a chapter and placed at the bottom of the page on which the reference number appears.
7. Page ordering and numbering: roman numeral page numbers appear in the frontmatter (prior to the introduction or Chapter 1). The first numbered page is the Abstract (iv). Arabic numbering from '1' starts in the Introduction or Chapter 1 if there's no Introduction.
8. Optional material supported:
 - Dedication
 - Acknowledgements

¹ E-mail: mgratton@math.duke.edu

- Introduction (different from 'Chapter 1: Introduction')
- Appendices

This class also provides some handy features:

1. Use the option 'economy' to get a single-spaced document appropriate for giving to colleagues.
2. Change your copyright from 'All rights reserved' if you're not actually reserving all your rights.
3. New Look: boldface mostly removed in headers for a lighter feel. The word 'Chapter' no longer appears on opener pages, only the number.

2.2 Limitations

In it's current form, this class does not support committees larger than six members, or titles longer than four lines. The figure-to-caption space has been abbreviated, as most plotting programs provide ample bottom margins. This default may not be acceptable in all cases.

2.3 Class options

The class supports the following options. Options appear in pairs with the default option in each pair listed first. The exception is the first listed option, which merely activates several other options for convenience.

economy Macro. Enables the options `singlespace`, `nogradschool`, and `nobind`. **Changed in version 0.3**

gradschool Default. Produces signature lines and a UMI abstract title page.

nogradschool Supresses the above.

PhD Default. Format is suitable for a Ph.D dissertation.

MS Modifies the format for Masters Theses. Changes the text on the title page, omits the UMI page, and generates warnings when forbidden document parts are used (i.e., Biography).

openany Default. Allows a chapter to start on any page.

openright Chapters only start on right-hand pages. Only makes sense for twosided documents.

oneside Default. Wide margin (where the binding will be) always occurs on the left edge of a page.

twoside Wide margin occurs on the left of odd pages and the right of even pages. This is for binding duplex printed documents.

final Default. No extra marks, include all pictures.

draft Prints black bars on pages where the contents overflow the margins. Suppresses the inclusion of graphics for speed.

doublespace Default. Double-spaces body text and adds extra space between entries in the Table of Contents, List of Figures, List of Tables, List of Abbreviations, and Bibliography.

singlespace Normal distances between baselines in all cases. Normal spacing in all list-type environments.

newstyle Default. Lighter look for headings.

oldstyle Headings in the classic L^AT_EXstyle. **New in version 0.3**

bind Default. 1.5in margin for binding appears on spine-side of a page.

nobind Left and right margins are both 1.25in. **New in version 0.3**

The default options are chosen so that the document will pass the Ph.D format specifications of the graduate school.

Here are some handy examples. Format required by graduate school:

```
\documentclass{dukedissertation}
```

Easy-to-read format for printing, sending to collaborators, etc:

```
\documentclass[economy]{dukedissertation}
```

Suitable for spiral bound copies and the like

```
\documentclass[economy, twoside, bind]{dukedissertation}
```

3

Basic Document Class Features

This chapter is an example of how to format normal material in the dissertation style. Most of this information is standard to L^AT_EX.

3.1 Intra-chapter divisions: Sections

Section headlines are `\Large` and in the standard font. Compare them to subsections below.

3.1.1 Subsections: Wow! Italics!

Yes, italics. You may now dance. Isn't it funny that upright letters are called "roman" while slanted letters are "italic". That's like Italian, and Romans are Italians too. What gives?

Subsubsections: Smaller and smaller

Subsubsections are allowed, but are not numbered and don't appear in the table of contents. Likewise, you can use the next level of sectioning.

Paragraphs These divisions are unnumbered and do not appear in the Table of Contents.

Subparagraphs This is the finest division possible. It's also unnumbered and omitted from the Table of Contents.

3.2 Let's do some math

Let's look at an equation:

$$\partial ft = f(t) \quad \text{subject to} \quad f(0) = c. \quad (3.1)$$

We've used the `\newcommand` defined in the preamble of `dissertation.tex` to produce the derivative. You can get a second derivative like $\partial^2 ft^2$ by adding some sneaky superscripts. Fancy.

More advanced equation formatting is available in the AMS environments. See the guide `amsmath user's guide`. Here are some nice examples of cases people usually have trouble with.

An equation that's too long for one line — use `multline`:

$$\begin{aligned} a + b + c + d + e + f + g + h + i + j + k + l + m + n + o \\ = p + q + r + s + t + u + v + w + x + y + z. \end{aligned} \quad (3.2)$$

An equation with multiple parts and one number per line — use `align`:

$$a_1 = b_1 + c_1 \quad (3.3)$$

$$a_2 = b_2 + c_2. \quad (3.4)$$

The same equation, set inside the `subequations` environment:

$$a_1 = b_1 + c_1 \quad (3.5a)$$

$$a_2 = b_2 + c_2. \quad (3.5b)$$

Notice that by clever placement of labels, I can reference the pair via (4), the first (3.5a), or the second (3.5b). One number for multiple equations can be accomplished using the `split` environment:

$$\begin{aligned} a &= b + c - d \\ &\quad + e - f \\ &= g + h \\ &= i. \end{aligned} \tag{3.6}$$

People often struggle under the complicated and ugly `'eqnarray'` environment. Don't do it! The AMS ones are easy. Other stumbling blocks are cases:

$$a = \begin{cases} b & \text{for } x > 0 \\ c & \text{otherwise,} \end{cases} \tag{3.7}$$

matrices:

$$A = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}, \tag{3.8}$$

and evaluation bars:

$$a = \left. \frac{\partial u}{\partial x} \right|_{x=0}. \tag{3.9}$$

See the source file for details.

When we reference an equation with something like `\eqref (3.1)`. If you click on the above references in the PDF, your viewer should scroll up to the above equation. It's handy. Labels and references may be attached to all sorts of objects. There is a `\label` attached to this chapter (it appears at the top of this file), and we may reference it by `(Chapter~\ref{chap:example})`, producing “Chapter 3”. By default these ref's are hyperlinked as well. Later, we'll see labeled and referenced figures and tables. Particular pages may be labeled with standard `\label` commands in the text and referenced via `\pageref`.

You might also like the links from `\cite` commands to the corresponding bibliographic entry. Go look at this imaginary book by Stephen Colbert [?]. If you're not a bibtex expert, look in `mybib.bib` at the `@ARTICLE` that generated this entry. It shows an example of accents on author names and how to preserve upper-case for letters in the title. Other entries show the use of the `and` keyword between author names. You may order a particular author's name as either "first last" or as "last, first". The actual format of the bibliography is controlled by the `\bibliographystyle{}` command in `dissertation.tex`.

3.3 Table of Contents Behavior

Now is a good time to look back at the Table of Contents. Notice that you may click on entries here to warp to the corresponding document location. In Adobe Acrobat and many other viewers, you can open a 'bookmarks' pane. This should be populated with named and numbered sections and subsections identical to the Table of Contents.

3.4 Figures and footnotes

Figures are set with very little space between the caption and the bottom of the included graphic. This is because most graphics programs pad the edges of images. If you find the spacing unsatisfactory, you may always add a bit manually. The text of the caption is single-spaced, and the word 'Figure' is set in small caps. See Fig. 3.1. Notice the use of the nonbreakable space "`~`" between the "Fig." and the reference. Figures (and tables) are examples of 'floats' — objects that \LaTeX decides where to place for you. You may give \LaTeX some hints. Change the `\begin{figure}[tbp]` to a `\begin{figure}[b!]` to restrict the placement. Inside the `[]`, you can put the following

FIGURE 3.1: Longer caption for actual body of dissertation. Figure captions should be BELOW the figure.

- t Allow placement at the top of the page
- b Allow placement at the bottom of the page
- h Allow placement 'here', in the middle of the page close to the text that the figure environment appears next to.
- p Allow placement on a separate 'floats page' that has no body text.
- ! Tighten the screws on the placement algorithm. This doesn't force things to happen as you say, but it makes it much more likely. Be careful: the bang option can cause figures to appear above the chapter title and in other bad locations.

Notice that each entry just changes what is *allowed*, but no preference among the

entries can be registered. The default is `[tbp]`, which is a very good default for a document like this, since floats in the middle of a page trap too much whitespace for double-spaced text. There is also a prohibition against having a page with more than 75% float. Instead, long floats will get kicked over onto float pages. Float pages are often a bad idea, as the creation of one will often cause a domino effect, with all subsequent figures appearing on float pages themselves, and all these float pages appearing together at the end of the chapter. (This is more like sinking than floating.) Avoid this by physically moving where the figure environment appears in your source file to an earlier location. Don't be afraid to put the environment before the first spot you reference it! Many float problems can be solved by a combination of relocating the figure environment and a little fiddling with the `[]` options.

Also notice the order of the graphic, caption, and label. If you deviate from this, strange things can happen. The caption of this figure shows the use of short captions (inside `[]`). These caption appear in the List of Tables, while the `caption` captions appear in the body. If you omit the `[]` short caption, the long caption will be used in its place.

Another technical note: since this style sheet is designed for processing by `pdflatex`, `\includegraphics` looks for PDFs, PNGs, and JPGs instead of the usual PS, EPS, and TIFF formats. You can convert existing graphics with a vareity of tools. PDF graphics are preferred, as they scale nicely. The open-source software Inkscape runs on Mac OSX, Windows, Linux, and some UNIX variants. Versions 0.46 and beyond have great support for creating and editing PDFs. It can even be used to convert other docs.

3.4.1 List of Figures

If you've put even one measly figure in your document, grad school rules say you need a List of Figures. It's automatically generated for you if you do a `\listoffigures`

Table 3.1: Long table caption appears on in the body text. See the short caption in the List of Tables. Table captions need to be ABOVE the table.

Numbers	Letters	Symbols
1	a	†
2	b	☺
3	c	×
4	d	#

in the master file (heck, it's there right now). Go look at the list of figures now. You should be able to click on the figure number to warp to the figure. You'll also see the result of the 'short caption' used above.

3.5 Table example

Just to make sure tables are formatted correctly, here's an example of a table float, see Table 3.1. You should note that [b] formatting (`\begin{table}[b]`) can cause floats to appear under the footnotes. Try changing it here and see the ugliness. Tables are identical to figures, except that the word 'Table' appears in the caption and its entry is in the List of Tables instead of the List of Figures.

3.5.1 Footnotes

Footnotes are allowed.¹ They are numbered with arabic numerals inside each chapter and appear at the bottom of the page.² The little footnote numbers are also hyperlinks. Try clicking them. You should place the footnote command immediately following the period of the sentence it is attached to. Any spaces or newlines will result in strange spacing between the number and the sentence.

¹ But, you should probably just work them into the text since it's annoying to jump around when reading.

² ...rather than the end of the chapter or the thesis. Those would properly be endnotes, I guess.

3.6 Corner cases in formatting, such as very very very long section titles. Man, this goes on forever.

Common corner-cases involve very long titles (like above). In these cases, the long titles are set single-spaced both here and in the Table of Contents.

3.6.1 Figure and Table caption cases are neat, and this is an absurdly long subsection heading

Consider the shield logo again with an absurd caption, as in Fig. 3.2. Also examine the new table, Table 3.2. Both of these have been forced onto a floats page so you can see what that looks like.

Nonsense text for layout proofing

Enjoy some Lorem Ipsum text! This should create about two full pages of text so you can verify the margins are correct (especially if you're doing two-sided).

4.1 Lorem Ipsum

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Sed vitae leo. Pellentesque quis nisi id orci consectetur posuere. Quisque malesuada rhoncus dui. Vivamus mi. Mauris commodo. Phasellus lacus magna, feugiat ac, blandit ut, rutrum id, massa. In consectetur magna vel justo. Cras eu diam. Nullam tortor turpis, bibendum non, consequat ac, tincidunt non, nisi.

Curabitur sagittis dignissim arcu. Pellentesque habitant morbi tristique senectus et netus et malesuada fames ac turpis egestas. Vestibulum ullamcorper. Curabitur faucibus euismod nulla. Vivamus sagittis. Sed fermentum neque a risus vestibulum convallis. Morbi id massa ut arcu mollis commodo. Aliquam erat volutpat. Pellentesque fringilla pellentesque nisi. Biography

Your biography is limited to one page and must contain

1. Full name
2. Date and place of birth
3. Every degree you've earned, including this one, and where you earned it from.

Mostly, that information is to narrow down which John Smith wrote that dissertation on the mating habits of sea cucumbers. Sexy!

You may also include

1. Any awards you've won related to your discipline since your undergraduate degree.
2. Any fellowships you've held
3. Anything you've published (papers, books, book chapters). Don't be afraid to cite it here, so that the full bibliographic record of your article appears in the bibliography!
4. Where your next job will be, if you know
